Setting information

Installation temperature:

-5°C to +40°C

Service temperature range:

Hilti HIT-CT 1 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Max, long term base material temperature	Max, short term base material temperature
Temperature range I	-40 °C to + 40 °C	+ 24 °C	+ 40 °C
Temperature range II	-40 °C to + 80 °C	+ 50 °C	+ 80 °C

Max, short term base material temperature

Short term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max, long term base material temperature

Long term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time

Temperature of the base material	Max, working time in which anchor can be inserted and adjusted t_{work}	Min, curing time before anchor can be fully loaded $t_{\text{cure}}^{1)}$
-5 °C < t_{BM} < 0 °C	1 hour	6 hours
0 °C $\leq t_{\text{BM}}$ < 5 °C	40 min	3 hours
5 °C $\leq t_{\text{BM}}$ < 10 °C	25 min	2 hours
10 °C $\leq t_{\text{BM}}$ < 20 °C	10 min	90 min
20 °C $\leq t_{\text{BM}}$ < 30 °C	4 min	75 min
30 °C $\leq t_{\text{BM}}$ < 40 °C	2 min	60 min

1) The curing time data are valid for dry base material only. In wet material the curing times must be doubled.

According to EN 1992-1-1 $\ell_{b,min}$ (8.6) are calculated for good bond conditions with maximum yield strength $f_{yk}=1,15$ and $\alpha_6 = 1,0$

Temperature reduction factor $k_{fi}(\theta)$

The analytic equation that describe the variation of $k_{fi}(\theta)$ with temperature is given by the following function:

If $39^{\circ}\text{C} \leq \theta \leq 376^{\circ}\text{C}$: $k_{fi}(\theta) = 41,001 \times \theta^{-1,012} \leq 1,0$ θ in $^{\circ}\text{C}$
 If $\theta < 39^{\circ}\text{C}$ $k_{fi}(\theta) = 1.0$
 If $\theta > 376^{\circ}\text{C}$ $k_{fi}(\theta) = 0.0$

The design value of ultimate bond strength $f_{bd,fi}$ under fire exposure is calculated according to following equation:

$$f_{bd,fi} = k_{fi}(\theta) \cdot f_{bd} \cdot \gamma_c / \gamma_{M,fi}$$

With:

- $k_{fi}(\theta)$ temperature reduction factor under fire exposure.
- f_{bd} design values of the ultimate bond resistance according to amplification factor α_{lb}
- $\gamma_c = 1,5$ recommended safety factor according to EN 1992-1-1.
- $\gamma_{M,fi}$ safety factor according to EN 1992-1-2 under fire exposure.

Steel failure

b) Overlap joint application

Max. bond stress, $f_{bd, FIRE}$, depending on actual clear concrete cover for classifying the fire resistance. It must be verified that the actual force in the bar during a fire, $F_{s, T}$, can be taken up by the bar connection of the selected length, l_{inst} . Note: Cold design for ULS is mandatory.

$$F_{s, T} \leq (l_{inst} - c_f) \cdot \phi \cdot \pi \cdot f_{bd, FIRE} \quad \text{where: } (l_{inst} - c_f) \geq l_s;$$

l_s = lap length

ϕ = nominal diameter of bar

$l_{inst} - c_f$ = selected overlap joint length; this must be at least l_s ,

but may not be assumed to be more than 80ϕ

$f_{bd, FIRE}$ = bond stress when exposed to fire

Critical temperature-dependent bond stress, $f_{bd, FIRE}$, concerning “overlap joint” for Hilti HIT-CT 1 injection adhesive in relation to fire resistance class and required minimum concrete coverage c .

Fitness for use

Some creep tests have been conducted in accordance with ETAG guideline 001 part 5 and TR 023 in the following conditions: **in dry environment at 50 °C during 90 days.**

These tests show an excellent behaviour of the post-installed connection made with HIT-CT 1: low displacements with long term stability, failure load after exposure above reference load.

Electrical Conductivity

HIT-CT 1 in the hardened state **is not conductive electrically**. Its electric resistivity is $1,4 \cdot 10^{10} \Omega \cdot m$ (DIN IEC 93 – 12.93). It is adapted well to realize electrically insulating anchoring (ex: railway applications, subway).

Installation temperature range:

+5°C to +40°C

Service temperature range

Hilti HIT-CT 1 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range	-40 °C to +80 °C	+50°C	+80 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Working time and curing time ¹⁾

Temperature of the base material T_{BM}	Working time t_{gel}	Curing time t_{cure}
$-5\text{ °C} < t_{BM} < 0\text{ °C}$	60 min	6 h
$0\text{ °C} \leq t_{BM} < 5\text{ °C}$	40 min	3 h
$5\text{ °C} \leq t_{BM} < 10\text{ °C}$	25 min	2 h

$30\text{ °C} \leq t_{BM} < 40\text{ °C}$	2 min	60 min

1) The curing time data are valid for dry anchorage base only. For water saturated anchorage bases the curing times must be doubled.
